Head Section Leader: Gregory Bruich, Ph.D.
Using Big Data to Study Teachers’ Impacts

School district records
2.5 million children
18 million test scores

Tax records
Earnings, College Attendance, Teen Birth

Source: Chetty, Friedman, Rockoff: “Measuring the Impacts of Teachers I and II” AER 2014
One prominent measure of teacher quality: teacher value-added

How much does a teacher raise her/his students’ test scores on average?
Debate About Teacher Value-Added Measures

- Controversial and highly politicized debate about using teacher value-added (VA) measures to evaluate teachers

- At its core, debate revolves around three statistical issues:
  
  1. Potential for bias in VA estimates
     
     - Do differences in test-score gains across teachers capture causal impacts of teachers or are they driven by student sorting?
Debate About Teacher Value-Added Measures

- Controversial and highly politicized debate about using teacher value-added (VA) measures to evaluate teachers

- At its core, debate revolves around three statistical issues:
  
  1. Potential for bias in VA estimates
  
  2. Lack of evidence on teachers’ long-term impacts
     
     - Do teachers who raise test scores improve students’ long-term outcomes or are they simply better at teaching to the test?
Debate About Teacher Value-Added Measures

- Controversial and highly politicized debate about using teacher value-added (VA) measures to evaluate teachers
- At its core, debate revolves around three statistical issues:
  1. Potential for bias in VA estimates
  2. Lack of evidence on teachers’ long-term impacts
  3. Instability of VA estimates
    - Are estimates of teacher quality based on a few years of data too unstable to be useful for policy?
Measuring the Impacts of Teachers

- Ideal experiment to answer these questions: randomly assign students to teachers with different value-added

- Test whether those with high value-added teachers have higher test scores and earnings

- We use a quasi-experimental approximation to this experiment
  - Exploit the fact that there is a lot of turnover in teachers across school years
  - When high VA teachers arrive at new schools, do scores go up?
  - Methodology: event-study designs
A Quasi-Experiment: Entry of High Value-Added Teacher

Entry of Teacher with VA in top 5%

Average Test Score

School Year

Scores in 4th Grade

Scores in 3rd Grade
A Quasi-Experiment: Entry of Low Value-Added Teacher

Scores in 4th Grade
Scores in 3rd Grade

Entry of Teacher with VA in bottom 5%
Lesson 1: VA Estimates Are Unbiased Measures of Teacher Effectiveness

- Students assigned to higher value-added teachers have higher test scores
  - Being assigned to a teacher who is predicted to raise test scores by 10 percentiles increases a given student’s score by ~10 percentiles
  - Differences in VA measures largely capture causal effects of teachers, not differences in types of students they are assigned (selection)
Effect of Teacher Quality on College Attendance Rates

Teacher Quality (Value-Added) Percentile

Attending College at Age 20
Effect of Teacher Quality on Earnings

Teacher Quality (Value-Added) Percentile

Earnings at Age 28

$20.5K

$21.0K

$21.5K

$22.0K

5th

Median

95th

Teacher Quality (Value-Added) Percentile
Effect of Teacher Quality on Teenage Birth Rates

- Women with Teenage Births
- Teacher Quality (Value-Added) Percentile

The graph shows a negative correlation between teacher quality and teenage birth rates. As teacher quality percentile increases (moving from 5th to 95th), the percentage of women with teenage births decreases.
Lesson 2: VA Estimates Based on Test Scores Predict Teachers’ Long-Term Impacts

- Assigning a student to a higher value-added teacher raises not just test scores but long-term outcomes
  - Teachers who generate high test scores are not just “teaching to the test”
The Value of Improving Teacher Quality

Teacher Quality (Value-Added) Percentile

5th  Median  95th
+$80,000 \text{ lifetime earnings per child} \\
= \$2.2 \text{ million per classroom of 28 students} \\
= \$407,000 \text{ in present value at 5\% int. rate}
Reliability of Teacher Value-Added Estimates

- Previous calculation overstates feasible gain because we do not observe each teacher’s value-added perfectly.

- In practice, we usually have performance data for just a couple of years before we need to make personnel decisions.
  - VA estimates based on a couple of classes are statistically imprecise.
  - Teachers who happen to have students who do well by chance will get a high VA score.

- Does this estimation error in VA reduce gains from previous exercise?
Selecting Teachers on the Basis of Value-Added Estimates

Teacher’s Actual Effect on Test Scores

Density

True VA
Selecting Teachers on the Basis of Value-Added Estimates

The graph illustrates the distribution of teacher's actual effect on test scores, comparing true value-added (VA) with estimated value-added below the 5th percentile after 3 years. The true VA distribution is shown in blue, with the estimated VA below the 5th percentile in red. The yellow area indicates the overlap and the difference between the two distributions.
Gain from Deselection on True VA = $407,000

Earnings Gain from Teacher Replacement Based on Estimated VA

Gain from Deselection on True VA = $407,000
Lesson 3: VA Estimates Based on a Few Years of Data Are Sufficiently Reliable to Generate Large Gains on Average

- VA estimates do fluctuate depend upon which students teachers get

- But even taking this into account, gains from replacing teacher with estimated VA in bottom 5% with teacher of average quality is $250,000
  - Less than $400,000 gain we’d achieve if there were no measurement error in VA, but still substantial
Relevance of Findings to Current Policy Debate

- Most school districts in the U.S. do not use any performance metrics to evaluate teachers
  - In many districts, 98%+ of teachers get tenure within 3 years
  - Pay set purely based on experience, not performance

- New evidence on VA metrics has sparked interest in changing this system and finding ways to recruit and retain best teachers more effectively
“We know a good teacher can increase the lifetime income of a classroom by over $250,000.... Every person in this chamber can point to a teacher who changed the trajectory of their lives”

“A recent study by Harvard and Columbia economists found that students with effective teachers are less likely to become pregnant, more likely to go to college and more likely to get higher-paying jobs....Ineffective teachers are hurting our students’ futures – we can’t allow that.”

- Michael Bloomberg, *State of the City*, 2012

Summary: Improving Public Schools

- New data show that changing public schools in certain specific ways can have large long-term returns

- Reducing class size can be very valuable
  - But critical to hire highly effective new teachers when doing so

- There are large, measurable differences in teacher quality,
  - We should do more to attract and retain top teachers in public schools (not just using value-added metrics but also other tools)
Marked-Based Solutions: Charter Schools
Market-Based Solutions to Improving Education

- Alternative approach to improving education: leverage market forces
- Permit school choice → best schools will attract more students and other schools will improve their performance to stay in business
- Two ways we currently take such an approach in the U.S.
  1. Charter schools: schools that are publicly funded but independent of public school system
  2. Vouchers that students can use for private schools instead of their local public school
Do Charter Schools Work?

- Question: are private schools/charter schools better than public schools?

- Cannot simply compare outcomes at charters and public schools
  
  - Charters tend to be concentrated in lower-income, urban areas → outcomes worse on average
Several recent studies estimate effects of charter schools on students’ outcomes by exploiting lotteries for admission

- Charter schools often have more applicants than seats → use lotteries to assign seats
- Comparing outcomes of winners vs. losers identifies causal effects

Effects of Boston Area Charter Schools

- Abdulkadiroglu et al. (2011): compare effects of charter schools and pilot schools in Boston
  - Charter schools are exempt from all public school regulations
  - Pilot schools are like charters but covered by Boston Public School regulations and teachers union contracts
  - Both are financed by payments from students' home district: tax payments transferred to charter/pilot school
Effects of Boston Charter and Pilot Schools on Test Scores
Effects of Boston Area Charter Schools

- Subsequent study by Angrist et al. (2013) shows that Boston charters have significant effects on college attendance rates.

- Lesson: charters generate positive effects on average; pilots are no better than public schools.
  - Suggests that the flexibility obtained by relaxing public school restrictions (e.g., on teacher hiring) is a key driver of positive impacts.
Effects of Charter Schools: Summary

- Chabrier et al. (2016) summarize literature on charter schools
  - Small positive mean effects on test scores on average
  - In general, “no excuses” schools (extra hours, discipline, academic focus) tend to have positive impacts
Does market discipline lead to growth of better schools and improvement in performance over time?

Baude, Casey, Hanushek, and Rivkin (2014) study how quality of charter schools in Texas changed over time.

Market Competition and Charter Schools

- Charter school market is evolving in a positive direction
  - Better schools gaining enrollment over time
  - But still a number of relatively low-performing schools, even many years after system began
Limitations of Market Competition

- Three limitations of relying purely on private market competition

  1. Markets may function poorly when quality is not well observed

     - Difficult to gauge value-added, especially when outcomes (e.g. college, earnings) are realized 10+ years after treatment
Limitations of Market Competition

- Three limitations of relying purely on private market competition
  1. Markets may function poorly when quality is not well observed
  2. Cream skimming of students and teachers
     - Private schools have an incentive to reject less qualified applicants
     - Can exacerbate inequality by leaving less qualified students behind in schools with fewer resources and weaker peers
Limitations of Market Competition

- Three limitations of relying purely on private market competition
  1. Markets may function poorly when quality is not well observed
  2. Cream skimming of students and teachers
  3. Parents may not make well-informed choices

- Low income parents are much less likely to choose schools with high test scores than high income parents

- School choice can amplify achievement gaps
We now have simple, empirically proven ways to improve primary education

- Solutions range across political spectrum: more resources to reduce class size in public schools to expansion of “no excuses” charter schools

Which approach is better: government or market based?

- Current constraints in public school system (local property tax funding base, regulations on teacher hiring) limit its effectiveness
- But unregulated market system likely to deliver highly variable outcomes

Best system may be a hybrid that preserves flexibility within schools while offering uniform quality and resources across schools
